High Quality and Innovative Chelating Agents

CheMatech, established in 2005, is a unique company in Europe specializing in the design and synthesis of chelating agents such as DOTA, NOTA and NODA-GA derivatives. These molecules are widely used for peptides and antibodies radiolabeling for nuclear medicine and as contrast agents for MRI.

CheMatech offers a wide range of ready-to-use bifunctional chelating agents and functionalized/protected macrocycles from milligrams to kilogram scale.

Our mission

Our mission is to serve the nuclear medicine and molecular imaging community by providing high quality and innovative chelating agents.

Expertise and Experience

CheMatech was built up around the know-how acquired in the field of chelating agents and fluorescent probes chemistry, radiochemistry and bioconjugation technologies for over three decades in the Institute of Molecular Chemistry at the University of Burgundy, Dijon, France.

Custom Synthesis and Contract Manufacturing

CheMatech delivers high-quality custom synthesis and contract manufacturing services necessary to accelerate your research and development programs. We provide the skills, experience and chemistry support services for the custom synthesis of mg to kg quantities of chelating agents for use in research and development.

cGMP synthesis

CheMatech provides a cGMP service to produce starting materials and intermediates. We conduct in-house cGMP manufacturing of chelating agents from grams to kilo in a dedicated cGMP area. For the production of cGMP APIs, CheMatech works with a CMOs network allowing the production from grams to multi-kilos.

Bioconjugation Services

CheMatech offers bioconjugation service. In order to get images and information of the best quality, it is primordial to choose the most adapted chelator for a given metal to avoid the release of the radionuclide in vivo. Our wide range of chelators allows the specific bioconjugation onto cysteines, lysines and by "click-chemistry".

We also offer the possibility to add a fluorescent probe in order to perform optical imaging. These bimodal systems are of great interest as diagnostic tools or for surgery assistance. Both the chelator and the fluorescent probe can be modulated in order to obtain a bimodal system adapted to your needs.

Preclinical Imaging

Preclinical imaging is the visualization of animals for research purposes, such as drug development. Imaging modalities have long been crucial to the researcher in observing changes, either at the organ, tissue, cell, or molecular level, in animals responding to physiological or environmental changes. Imaging modalities that are non-invasive have become especially important to study animal models longitudinally. Broadly speaking, these imaging systems can be categorized into primarily morphological/anatomical and primarily molecular imaging techniques. Techniques such as high-frequency micro-ultrasound, magnetic resonance imaging (MRI) and computed tomography (CT) are usually used for anatomical imaging, while optical imaging (fluorescence and bioluminescence), positron emission tomography (PET), and single photon emission computed tomography (SPECT) are usually used for molecular visualizations.

CheMatech, a leading company in the design and synthesis of chelating agents, is a full member of the scientific and economic consortium Pharm'Image dedicated to pharmaco-imaging. Through Pharm'Image we can offer you different modalities of preclinical imaging such as nano-SPECT/CT, nano-PET/CT, nano-MRI, fluorescence imaging.
